

Publish Your Local Project to GitHub (GUI)

You have a folder like:

```
~/my-flask-app
```

Now let's publish it as a **new repository on GitHub**, step-by-step using the **GitHub web GUI**.

Step 1: Go to GitHub.com

1. Login to <https://github.com>
2. Go to your profile (top right)
3. Click "**Your repositories**"
4. Click the green "**New**" button

Step 2: Fill in Repo Details

- **Repository name:** `my-flask-app` (or anything you like)
- **Description:** optional
- **Visibility:** choose Public or Private
- ☒ **Do NOT check "Initialize with README"** (you already have files)

Click **Create repository**

Step 3: Copy the Remote URL

After creating the repo, GitHub shows setup instructions.

Copy the **"HTTPS"** URL:

Example:

```
https://github.com/make2grow/my-flask-app.git
```

Step 4: Push from Local Folder

Now go to your terminal:

```
cd ~/my-flask-app  
  
git init  
git remote add origin https://github.com/make2grow/my-flask-app.git  
git add .  
git commit -m "Initial commit"  
git branch -M main  
git push -u origin main
```

```
smcho@m4 my-flask-app> git config user.name make2grow
smcho@m4 my-flask-app> git config user.email make2gr@gmail.com
smcho@m4 my-flask-app> git push -u origin main
remote: Permission to make2grow/my-flask-app.git denied to nkuase.
fatal: unable to access 'https://github.com/make2grow/my-flask-app.git/': The requested URL returned error: 403
```

You need to run this command to change protocol:

```
git remote set-url origin git@make2grow:make2grow/my-flask-app.git
```

Done!

Your local folder is now a GitHub repository.

You can view it at:

```
https://github.com/make2grow/my-flask-app
```

and pull/push from any machine.

Next Steps

- Set up GitHub webhooks for auto-deploy
- Invite collaborators
- Enable issues or wikis
- Add a README or LICENSE

 **Project is now version-controlled and online!**
