

Auto-Pull Flask App on Alpine

Learn how to:

- Install Git on Alpine Linux
- Clone GitHub repo
- Set up deploy script to auto-update your Flask app

Step 1: Install Git on Alpine

Run the following commands:

```
apk update  
apk add git
```

 This installs Git so you can pull from GitHub

Step 2: Clone Your GitHub Repository

Example:

```
cd /home/deploy  
git clone https://github.com/make2grow/my-flask-app.git
```

- Clones the repo into `/home/user/my-flask-app`
- You can now build and run from this folder

Step 3: Create the Deploy Script

Create the script:

```
nano /home/user/deploy.sh
```

Paste the following:

```
#!/bin/sh
cd /home/user/my-flask-app
git pull origin main
docker build -t flask-app .
docker stop flask-running
docker rm flask-running
docker run -d --name flask-running -p 80:5000 flask-app
```

Make it executable:

```
chmod +x /home/user/deploy.sh
```

Step 4: Run or Automate

You can run manually:

```
/home/user/deploy.sh
```

Or trigger it via:

- GitHub webhook
- cron job
- systemd or init script

Recap

Step	Description
<code>apk add git</code>	Install Git
<code>git clone</code>	Clone your Flask app
<code>deploy.sh</code>	Pull + build + restart container

 **Ready for Auto Deployment!**
