

Introduction to Postman for API Testing

A beginner-friendly overview of using **Postman** to test APIs.

What is Postman?

- A GUI tool for testing RESTful APIs
- Allows sending HTTP requests without writing code
- Useful for developers, testers, and API consumers

Why Use Postman?

- User-friendly interface
- Supports all HTTP methods
- Easily manage collections, environments, and tests
- Generate code snippets in multiple languages

Sending a GET Request

1. Open Postman
2. Choose `GET` method
3. Enter URL (e.g. `https://jsonplaceholder.typicode.com/posts/1`)
4. Click **Send**

✓ You will see the response body, headers, status code.

Sending a POST Request

1. Choose **POST** method
2. Enter URL (e.g. `https://jsonplaceholder.typicode.com/posts`)
3. Go to **Body** tab
4. Select **raw** and choose **JSON**
5. Paste JSON data:

```
{  
  "title": "foo",  
  "body": "bar",  
  "userId": 1  
}
```

6. Click **Send**

PUT and DELETE Requests

- Same steps as POST
- Choose `PUT` or `DELETE` method
- Provide appropriate URL and JSON payload (if needed)

Authorization

- Go to **Authorization** tab
- Choose **Bearer Token**
- Paste your token
- Headers are automatically added

Environment Variables

- Define variables like `{{base_url}}`
- Use them in requests to avoid repetition
- Great for switching between dev/staging/prod

Collections

- Group related requests into **Collections**
- Add descriptions, folders, and tests
- Share or export collections for team collaboration

Tests and Scripts

- Add JavaScript tests under **Tests** tab
- Example:

```
pm.test("Status code is 200", () => {  
  pm.response.to.have.status(200);  
});
```

- Great for automation and validation

Exporting & Sharing

- Export collections as JSON files
- Share via Postman Cloud
- Generate documentation automatically

Summary

- Postman is a powerful tool for API testing
- Simplifies sending requests, testing, and collaboration
- Ideal for manual and automated API testing workflows
