

Why Add Docker's Repository on Ubuntu?

When installing Docker on Ubuntu, we add Docker's official APT repository.

The Purpose

Ubuntu's default packages are often:

-  **Outdated** versions of Docker
-  Missing security patches or new features

By adding Docker's repository, we can:

- ✓ Get the **latest stable version**
- ✓ Install `docker-ce`, `docker-ce-cli`, `containerd.io`
- ✓ Use official signed packages

The Command

```
echo \  
  "deb [arch=$(dpkg --print-architecture) \  
    signed-by=/etc/apt/keyrings/docker.gpg] \  
    https://download.docker.com/linux/ubuntu \  
    $(lsb_release -cs) stable" | \  
sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
```

Breaking It Down

Part	What it does
<code>dpkg --print-architecture</code>	Gets system arch (e.g., amd64)
<code>lsb_release -cs</code>	Gets Ubuntu version code name (e.g., focal, jammy)
<code>signed-by=...</code>	Ensures packages are verified by Docker's GPG key
<code>tee</code>	Writes the line to <code>docker.list</code> with sudo
<code>> /dev/null</code>	Hides output from the terminal

If You Skip This Step

```
sudo apt install docker-ce
```

 Error: "Unable to locate package docker-ce"

Because Ubuntu doesn't know where to find Docker unless you add this repository!

Summary

- This command **registers Docker's official APT repository**
- It's a **one-time setup**
- Required to install and update **official Docker packages**

 **You're Ready to Install Docker!**
