

Individual Project

Individual Project

Define and solve a problem of your own choosing — on your own, with no leader/member split and no live presentation.

- **GitHub:** project artifacts — code, tests, docs, and design
- **Canvas:** goals, plans, weekly progress, links, and submissions
- **GitHub Pages:** project portfolio site

Project Process

- Follow the same two-sprint development cycle as the team project.
- Complete the individual HW2, HW4, and final deliverables listed on Canvas.
- There's no PPP/S1P/FP-style presentation — your artifacts carry the weight instead.

Peer Evaluation, Not Presentation

Instead of presenting to the class, each student is assigned to review **three peers'** individual projects — similar to a manager role, but assignments stay confidential.

- You record your own progress, and evaluate your three assigned peers, entirely through GitHub and Canvas.
- There's no leader, tech lead, or live demo in this loop — just documented evidence.
- If time allows, a live presentation may be added — check Canvas and prepare accordingly.

Documentation Is Your Presentation

Your GitHub and Canvas pages are how your peers understand your work.

1. **Write Clearly:** Explain the problem, your approach, and what's done — as if introducing it to someone new.
2. **Show Evidence:** Include test results and a short demo (screenshots or video) so progress is visible without you being there.
3. **Keep It Current:** Update Canvas weekly so your assigned peers always see accurate status.

Evaluation

There's no team leader or professor-led review here — **your assigned peers evaluate your project**, based on your GitHub and Canvas artifacts.

Use the current Canvas rubric for points and submission requirements.

What Your Peers Look At

- Planned vs. delivered work
- Sustained weekly progress
- Quality of code, tests, and documentation
- Acceptance-test evidence
- How clearly you documented risks and changes

Plan Ahead

Rushing at the last moment is a common cause of late, low-quality work.

1. **Plan Wisely:** Set your own target at least a week before the deadline.
2. **Communicate Early:** Report issues on Canvas as soon as they appear.
3. **Deliver Consistently:** The rubric evaluates sustained progress.

Changes in Goals or Plans

1. **Update Plans:** Report changes and their reasoning on Canvas.
2. **Update Artifacts:** Reflect the changes in the affected files on GitHub.
3. **Explain the Impact:** Describe how the change affects scope, schedule, or quality.

Project Results Can Strengthen Your Portfolio

1. **Prove Capability:** Show real problem-solving skills.
2. **Showcase the Work:** Use GitHub as your hub and prepare a concise project summary.
3. **Reflect:** Explain what worked, what failed, and what you learned.

Recommendations for Project Success

- Start early and finish early.
- Keep your progress visible — no surprises.
- Focus on growth, not only points.
- Ask for help when you need it.
